Appendix to: Farber R, Houssami N, McGeechan K, et al. The impact of the BreastScreen NSW transition from film to digital mammography, 2002–2016: a linked population health data analysis. *Med J Aust* 2025; doi: 10.5694/mja2.00000.

Table 1. Summary statistics for lapsed-screen cancers

A lapsed screen is when the next screen is undertaken after the recommended return to screen date (or there is no subsequent screen). There was a slightly higher rate of lapse screens with film 1,016,287 (66.2%) than with digital 721,622 (59.8%). However, it is inappropriate to compare lapsed cancers between film and digital mammography because by definition the cancer has occurred beyond the screening interval. i.e., because film has been around for longer there is a longer time for a cancer to develop since the lapsed screen. Below is a table of the time of the diagnosis of the lapsed cancer since the recommended return to screening date. While this gives a more accurate comparison for shorter periods from recommended screening, there is increased bias for longer periods from recommended screening since film has been around for longer. The comparison for 1 year from recommended screening is least biased, and the comparison for >5 years is most biased.

| | Digital | | | Film | | |
|-----------------------|--------------------|------------------------|------------------------------|----------------------|-----------------------|------------------------------|
| | Number | Rate per 1,000 screens | Rate per 1000 lapsed screens | No. | Rate per 1000 screens | Rate per 1000 lapsed screens |
| Screens | 1,206,371 | | | 1,535,184 | | |
| Lapsed screens | 721,622 (59.8%) | 598.1 | | 1,016,287 (66.2%) | 662.0 | |
| Lapsed cancers | 1,130 | 0.94 | 1.57 | 6,790 | 4.42 | 6.68 |
